Highly diastereoselective Michael addition of lithium diorganocuprates to the half-ester of 1,1′-binaphthalene-8,8′-dihydroxy-1,1′-binaphthyl gave β-substituted esters with high enantiomeric excess after methanolysis. The optically active phenolic sesquiterpenes turmeronol A (1) and B (2) have been synthesized using this reaction as a key step.

Key words: asymmetric reaction; 8,8′-dihydroxy-1,1′-binaphthyl; Michael addition; sesquiterpenoid; diastereoselectivity

Since optically active 8,8′-disubstituted-1,1′-binaphthyl creates a highly dissymmetric microenvironment around the substituents at C-8 and C-8′,1,2 it has attracted increasing attention in the field of catalytic3,4 and stoichiometric5 asymmetric synthesis, as a chiral proton source,6 and in recognition of chiral molecules.7 We previously reported a one-step synthesis of the optically active β-substituted ketones via tandem 1,4- and 1,2-addition of lithium dialkylcuprates to a half-ester of 1,1′-binaphthalene-8,8′-dihydroxy-1,1′-binaphthol (8,8′-BINOL).5a We previously reported a one-step synthesis of the optically active β-substituted ketones via tandem 1,4- and 1,2-addition of lithium dialkylcuprates to a half-ester of 1,1′-binaphthalene-8,8′-dihydroxy-1,1′-binaphthol (8,8′-BINOL).5a The reaction involves the Michael addition, followed by the formation of a ketene that undergoes the 1,2-addition and finally gives a β-substituted ketone with high enantiomeric excess (ee) (Chart 1). Temperature control was found to be crucial for the elimination of 8,8′-BINOL to yield an intermediate ketene. These findings suggested that it might be possible to obtain the 1,4-addition product by suppressing the elimination step under the reaction conditions. In this paper, we report this achievement and its application to the syntheses of optically active turmeronol A (1) and turmeronol B (2).

α,β-Unsaturated half-esters 3–8 were prepared by the condensation of 8,8′-BINOL with the corresponding acidides8 in the presence of 1-ethyl-3-(3-dimethylaminopropyl) carbodiimide (WSC) and 4-dimethylaminopyridine (DMAP). The half-esters were treated with lithium diorganocuprate in Et2O while maintaining the temperature below −20 °C to afford the desired Michael addition product. The results are shown in Table 1. Excellent diastereoselectivity and fair to good chemical yields were observed, except for entry 8. In the case of entry 8, the half-ester 7 had low reactivity against Me2CuLi due to the neighboring methoxy group. Increasing the reaction temperature and time did not improve the yield, and instead the product generated by 1,4-addition followed by 1,2-addition of the reagent was obtained.

Some of these products were easily converted to the chiral synthetic intermediates of aromatic bisabolane sesquiterpenes. Thus transesterification of optically active 13 and 17 using lithium methoxide gave the corresponding methyl esters 18 and 21 which were hydrolyzed to the acids 19 and 22 in high overall yield, respectively. Reduction of 18 with DIBAL afforded 20 in 91% yield. The optically active 19, 20, and 22 were previously transformed into a number of bisabolane sesquiterpenoids, as indicated in Chart 2.

To demonstrate the synthetic utility of the present asymmetric Michael addition, we synthesized optically active 1 and 2, inhibitors of soybean lipoxygenase isolated from the spice turmeric (Curcuma longa L.). To the best of our knowledge, only one synthesis of optically active 19 and synthesis of racemic 2118 have been reported. Chart 3 outlines the syntheses of 1 and 2. Demethylation of optically active...
with boron tribromide gave 23 in good yield. The corresponding Weinreb amide prepared by treatment with \(N,O\)-dimethylhydroxylamine hydrochloride was reacted with 2-methyl-1-propenylmagnesium bromide to afford (+)-turmeronol A (1) in 90% overall yield from 23. Demethylation of 25, prepared from 16, gave the lactone 26, which was transformed to (+)-2 via the sequence similar to that for (+)-1. Physical data including \(^1H\)-NMR spectra, IR spectra, and \([\alpha]_D^\text{20}\) values for synthetic (+)-turmeronol A (1) and B (2) were in satisfactory agreement with those of natural products.20
